(54) Title: SEAT CONSTRUCTION

(57) Abstract: The invention relates to a seat construction (1) comprising a seat cushion part (1 a) and a backrest part (1 b), and: a presence sensor (2) for detecting at least the presence of a person or an object placed in the said seat construction (1), means for ventilating the seat construction (1) comprising at least one duct (7) through the said presence sensor (2) and at least one air passage (9) through the rest of the seat construction (1), and a device (10) for feeding an air current through the said air passage (9) and through the said duct (7) for ventilation of a predetermined region (1c) adjacent to the seat construction (1). According to the invention, the seat construction (1) comprises a layer (12) of an air-distributing material disposed between the said presence sensor (2) and the said air-current-feeding device (10), whereby a flow path is provided for the said air current through the air passage (9), the duct (7), the said layer (12) of air-distributing material and the said air-current-feeding device (10). As a result of the invention, an improved seat construction is provided, having a presence sensor which also allows ventilation of the vehicle seat in an advantageous manner.
